

# TPLO Fast Facts

Where the Underdog always wins.

To date VOSM has performed

over  
**6,000**  
TPLOs

On average VOSM preforms **50** TPLOs per month

The surgical procedure itself takes just **under an hour** start to finish.

Our complication rate is less than **5%**  
well below industry standard of 12%

The chance of the opposite CCL tearing has been shown to **decrease** if formal rehabilitation is performed (ACVS 2014)

### 12 Weeks Post-Op

We receive referrals for TPLOs from **all over the USA and Canada**

The majority of clients travel from PA, NJ and NY

Canine athletes are able to **return** to sport and work following VOSM TPLOs

**3** Trained Surgeons, Rehab Vets, and Certified Rehab Therpists.

The TPLOs can be performed in dogs as small as 5 lbs and as large as 250 lbs

## What Vets Need to Know:

### Prior to your patient's 1st visit:

Please send any lab work and medical notes to our surgical coordinator: [coordinator@vosm.com](mailto:coordinator@vosm.com)

## What your client should expect:

### Patient's 1st visit:

Consult with our surgeon and surgery date set.

### Patient's Surgery Date:

***Drop off at 7am.***

We ask that patients be dropped off at 7 so that we can perform full exams on all surgical patients prior to performing any surgeries. This decreases the potential for infection in our surgical cases. At that time, we also inject an anti-nausea medication that takes several hours to take effect and decrease the chance of intra and post operative regurgitation.

### Patient will stay overnight:

Our recovery staff stays overnight with all boarders and post op patients to ensure they receive the same care they would during the day. Patients will receive IV fluids through the morning to keep the patient hydrated. Patients are fed a small meal every 4 hours and are sling-walked. Once the bandage is removed, a cold compress is put on the incision site. Medication is administered and vital signs are monitored throughout the night as well.

### Post op rechecks:

10-14 days after for suture removal

4 wks after for x-ray. The client will be given home exercises at this time.

8 wks second x-ray. The client will be given new home exercises at this time.

+/- 12 weeks for the last follow up radiographs.

### Rehab:

Rehab may be recommended depending on the surgery. We have a certified Rehab team, canine gym, and hydrotherapy room. However, if your facility also offers rehab, the client is welcome to come to you for rehab and follow up X-rays.
